A Comprehensive Digital Identity, Multi-Factor Authentication and Access Control System

ABSTRACT

IdentityX is a secure identity and authentication management system designed to protect users from unauthorized access and credential-based attacks. The system combines Multi-Factor Authentication (MFA), digital credential management, identity verification, and Role-Based Access Control (RBAC) to provide a secure authentication environment It allows users to securely register, authenticate, and manage their digital identities using methods such as passwords, OTPs, and other authentication factors. It also provides secure management and verification of user credentials, while administrators can control user roles and permissions. Security features such as password hashing, session management, authentication logs, and suspicious-login detection help improve the overall protection of user accounts.The main objective of IdentityX is to provide a centralized and reliable platform for managing digital identities and authentication. By combining multiple security mechanisms into one system, IdentityX can reduce the risk of unauthorized access and provide better security, accountability, and access control for modern applications and organizations.
